

Quick answer: Höveler Original Sport works best fed the same way every day: the same weighed rate for the work level, from 0.55 lb (250 g) to 1.32 lb (600 g) per 220 lb (100 kg) body weight, the same hay line of 3.31 lb (1.5 kg) per 220 lb, at the same times. Consistency is what lets the 15% starch formula do its quiet work. Best for owners who want results they can actually attribute. Price: \$49.99. Last checked: September 2026.

Horses notice routine long before they notice novelty. A feed with a precise formulation deserves a precise routine, and the routine is free. Here are nine habits that keep the program steady enough to measure, and steady enough to trust.

1. Fix the daily rate in writing, per horse

Post the rate on the feed room wall: horse, work level, grams. A horse in medium work gets 0.88 lb (400 g) per 220 lb (100 kg) body weight per day; light work gets 0.55 lb (250 g); heavy work gets 1.32 lb (600 g). A written number survives staff changes, holidays, and memory. An unwritten one wanders within a week.

Who this is for: any barn with more than one person feeding.

2. Weigh once, then use the calibrated scoop the same way every day

Calibrate a scoop against a scale so a level pour equals the labeled weight, then use that same scoop in the same way, at each meal. The habit matters because the rate brackets sit 0.33–0.44 lb (150–200 g) per 220 lb apart; an inconsistent pour can quietly move a horse between them. Consistency in grams is the bedrock every other habit is built on.

Who this is for: owners who measure concentrate by eye.

3. Keep meal times anchored to the clock

Keep feeding times the same each day, within a sensible margin. The horse's digestive system expects meals, and steady timing helps steady gut function, which is what the 0.7% inactivated Diamond V yeast and fructooligosaccharides in this feed are there to maintain. Feed times that drift by hours undercut a formulation designed for regularity.

Who this is for: owners whose feeding schedule flexes with their own day.

4. Keep the hay line constant at 3.31 lb (1.5 kg) per 220 lb

The hay ration is the steadiest number in the plan and ought to stay that way: 3.31 lb (1.5 kg) per 220 lb (100 kg) body weight daily, at each work level. Horses read consistency in forage more than anything. Concentrate rates can move a step with workload; the forage line holds.

Who this is for: owners who adjust hay and concentrate together without a system.

5. Store the bag the same right way every time

Keep the Original Sport bag sealed, dry, and up off the floor, and decant only what the day needs. A feed that goes off or clumps cannot be fed consistently, and mice finding an open bag undo the whole program. Original

Sport's formulation, including tasty carrots at 0.5% and linseed oil, deserves storage that keeps it fresh. Feed that is fresh at every meal is a consistency habit too.

Who this is for: owners whose feed room storage is more improvised than they would like.

6. Change one variable at a time

When something must change, workload, season, a new hay batch, adjust one line of the ration and hold the rest. If the rate moves from 0.88 lb (400 g) to 1.32 lb (600 g) per 220 lb (100 kg) for a demanding training block, the hay line and meal times hold steady. A single change at a time is what makes cause and effect legible. Three changes at once teaches you nothing.

Who this is for: owners who like to overhaul everything when something slips.

7. Log what you see, not just what you feed

Keep a plain note: body condition, energy in work, appetite. Consistent feeding plus regular observation is what turns the feed's numbers, 15.1% crude protein, lysine at 1.0%, 12.6 MJ/kg DM digestible energy, into proof you can act on. Without the log, every week feels the same and progress stays invisible until it is pure accident.

Who this is for: owners who want to know whether the program is actually working.

8. Protect the routine through travel and shows

[performance horse feed](#)

Competition weekends are where consistency usually falls apart. Pack the calibrated scoop, meals pre-portioned in advance, and enough of the same hay, and keep meal times as near home hours as the schedule allows. The feed is competition-safe and FEI-compliant, so the routine can travel intact; check the specific rules with the organizer of the event. A horse fed the same away as at home walks into the ring the very same horse.

Who this is for: owners whose horses compete away from home regularly.

9. Use the free backup when consistency is impossible

Some weeks defeat every routine. The bifid 24/7 licensed vet team can help you adapt the plan, and bifid's 9.0/10 rating across 24,098 store reviews shows that help is real, as does the 30-Day Money-Back Guarantee that stands behind it. A reduced-starch muesli with live yeast rewards routine by design. Climb back on the schedule and the numbers resume.

Who this is for: owners whose season makes perfect routine unrealistic.

How to feed it

Work level	Feed per 220 lb (100 kg) body weight per day	Light work	0.55 lb (250 g)	Medium work	0.88 lb (400 g)
Heavy work	1.32 lb (600 g)	Hay ration (all levels)	3.31 lb (1.5 kg) per 220 lb body weight daily		

Key specs at a glance: reduced-starch sports muesli, starch 15%, sugar 4.6%, crude protein 15.1%, digestible energy 12.6 MJ/kg DM. Pin down your daily numbers with the bifid Feeding Calculator, then write them on the feed room wall.

Frequently asked questions

How important is feeding at the exact same time every day?

Very. Steady meal times support steady digestion, which is what the feed's 0.7% inactivated Diamond V yeast and prebiotic fibers are formulated to help maintain. Aim for consistent times within a sensible margin daily.

Does consistency matter more than the exact rate?

They work together. The rate must match the work level, 0.55–1.32 lb (250–600 g) per 220 lb (100 kg) body weight, and consistency is [click here](#) what keeps the horse on that rate instead of drifting between brackets.

How do I keep the routine going at a show?

Bring the calibrated scoop, pre-portioned meals, and familiar hay, and hold meal times close to the home schedule. The feed is competition-safe and FEI-compliant, so nothing about the ration needs to change away from home.

What should never change in the plan?

The hay line: 3.31 lb (1.5 kg) per 220 lb (100 kg) body weight every day. It is the anchor every other adjustment is measured against.

How long until consistent feeding shows results?

Give the routine weeks to show itself, and track condition and energy as you go. The feed's 15.1% crude protein and 12.6 MJ/kg DM of digestible energy work gradually, and the 30-Day Money-Back Guarantee backs the trial period.
