They are triggered by an overgrowth of the dermis layer cells. Generally this happens after there has actually been small injury to the skin such as a bug bite, abrasion, or a prick to the skin. A dermatofibroma is just one of the typical benign tumors that occur regularly in females than men. As they have a tendency to expand gradually, often they are discovered after injury triggers them to bleed or become unpleasant, such as after they are reduced by mishap during shaving.

What autoimmune illness causes dermatofibroma?

Several dermatofibromas can be associated with numerous systemic conditions including physiologic adjustments of maternity [12], chromosomal irregularities such as Down syndrome [11], metabolic disturbances such as hypertriglyceridemia [18], hematologic malignancies [4, 36], immunodeficiencies such as HIV [5], and ...

CAUSES OF SKIN TAGS

Causes of Skin Tags

Researchers have not been able to pinpoint the exact reason why people develop skin tags. However, there are a number of theories or assumptions based on cases that researchers study and cross-reference. One theory is that irritation or friction may play a role. For example, skin tags usually develop on body folds where the skin folds and rubs together, like the underarms, groin, neck or eyelids.

However, some researchers think insulin resistance may play a major role because the growths are very common in patients with diabetes. It may also be related to viral infections. Another scientific study examined 49 patients with acrochordons. They noted that a large percentage of the subjects had the human papillomavirus (HPV). This detail suggests that there may be a correlation with this particular virus.

Doctors theorize acrochordons may be genetic. In a genetic disorder called Birt-Hogg-Dube Syndrome, patients often have numerous skin tags along with other skin conditions. However, skin tags may simply be a characteristic of normal aging as the skin loses elasticity.
