When players initiate a round, a grid (typically 5x5) is presented face-down. Concealed underneath these tiles are a set variety of mines-- determined by the user-- and a series of multipliers. Every time a player clicks a tile, they either expose **Bitz** a gem or multiplier that increases their potential payout or they strike a mine, which immediately ends the round and resets the stake. This instinctive design permits a low barrier to entry while maintaining an adrenaline-inducing ceiling.

## The Appeal of the Mines Mechanic

Why do players flock to these games over more graphically intense alternatives? The appeal depends on the mental pull of **agency**.

- 1. Personalized Risk:** Unlike slot machines where the result is purely RNG (Random Number Generator) with little gamer input, Mines video games permit the user to choose the trouble. By increasing the number of mines on the grid, the player increases the prospective multiplier for each successful tile. This provides the gamer the sensation that they are in the motorist's seat of their own volatility.

Players can stop at any time after a successful expose, securing their present earnings. This introduces a timeless game theory issue: *Do I take the earnings now, or push my luck for a greater payment?*
